

Project Title: LogiInsight 360 - Enterprise Supply Chain ERP

Target Industry: Supply Chain Management & Logistics (SCM Tech / IoT / AI)

Team Name: Data Pioneers

Team Members: Mamdouh Faheem – Maram Ibrahim – Mohamed Ayman – Rahma Osama – Sarah Elshenawy

1. The Core Problem (The "Why")

Over 60% of enterprise supply chains suffer from operational blind spots, inventory distortion, and massive financial losses due to siloed legacy ERP systems. Logistics, manufacturing, and procurement operate in isolated data islands, making it impossible to perform fast root-cause analysis when product damage, delay, or compliance breaches occur across the distribution network.

2. The Solution & Value Proposition (The "What")

LogiInsight 360 is an advanced Supply Chain Operating System that unifies end-to-end operational workflows into a central SQL Server database. By combining interactive Power BI dashboards with structured SSRS paginated tracking reports, the system generates a dynamic **"Fulfillment Success Score"**. The single most important benefit is minimizing operational cost and mitigating compliance risks by replacing manual tracking with real-time, automated AI diagnostics.

3. The AI Trinity Strategy (The "How")

- **LLM (Intelligence):** We utilize GPT-4o as a Virtual Supply Chain Consultant to sit on top of the Power BI dashboards, translating complex logistics charts and inventory trends into plain language executive summaries for operational managers.
- **RAG (Knowledge):** The AI system ingests specialized operational data, including live factory batch outputs (`Production_Batches`), warehouse logs (`Stock_Movements`), and vehicle tracking sensors (`Fleet_Telemetry`), ensuring pinpoint accurate business context.
- **Agents (Action):** AI Agents autonomously monitor real-time records in the SQL database. When a high-risk event occurs (e.g., a reefer truck's engine temperature spikes or an item hits its critical Reorder Level), the agent automatically triggers a detailed SSRS operational brief and triggers automated maintenance workflows.

4. Market & Competition

- **Primary User:** Supply chain directors, warehouse managers, operations executives, and corporate fleet dispatchers.
- **The Advantage:** Unlike generic tracking apps or static accounting ERPs, our solution offers a fully integrated technical layer that natively links raw batch production data, real-time IoT vehicle telematics, financial cost tracking, and autonomous AI-driven remediations.

5. Execution Plan (High Level)

- **Core Stack:**
 - **Data & Backend:** SQL Server (SSIS for complex data integration/ETL, SSAS for high-speed Tabular Modeling).
 - **Reporting & BI:** Power BI Service (for interactive monitoring) and SSRS (SQL Server Reporting Services for structured cargo briefs).
 - **AI Framework:** Python (for IoT ingestion & ML modeling) and Power AI Agents.
- **Risk Factor:** Achieving flawless synchronization between high-velocity streaming IoT `Fleet_Telemetry` tables and standard transaction registers while keeping cross-module data strictly normalized.

6. Platform Key Performance Indicators (Top 8 KPIs)

1. **OTIF (On-Time In-Full):** The core metric tracking the percentage of orders delivered perfectly on time and with full quantities to customers.
2. **OEE (Overall Equipment Effectiveness):** Measures the production lines' true availability, machinery speed, and quality output rates.
3. **Inventory Turnover Ratio:** Tracks how efficiently stock is rotated and liquidated to optimize corporate working capital.
4. **Cost-to-Serve Index:** The dynamic built-up calculation tracking the total procurement, production, storage, and transport cost per order.
5. **Scrap & Return Rate:** Monitors manufacturing material waste alongside downstream client product returns and rejections.
6. **Fleet Volumetric Utilization:** Evaluates truck loading efficiency by cross-referencing available weight capacity against dispatch requirements.
7. **Fuel Efficiency Deviation:** Flags gaps between pre-calculated route fuel expectations vs actual money logged in trip expense tables.
8. **Vendor SLA Compliance Score:** Ranks supplier fulfillment rates based on raw material delivery speed and physical incoming quality checks.

7. BI Dashboard Strategy (20 Analytical Layout Ideas)

A. Executive & Global Control Towers

1. **Global Supply Chain Control Tower:** Live central command tracking total active revenue, open purchase orders, in-motion fleet trips, and critical system faults.
2. **Dynamic Cost-to-Serve Blueprint:** Interactive cost matrix slicing production, storage, and transport expenses directly against margin profit lines.
3. **Customer Experience & Fulfillment Tracker:** Real-time visibility into customer satisfaction metrics, calculating live regional OTIF scores and return patterns.
4. **Resilience & Risk Radar:** Flags active bottlenecks such as imminent raw material stockouts, delivery delays, or pending breakdown threats.

B. Procurement & Manufacturing Insights

5. **Vendor Performance Scorecard:** Ranks third-party suppliers by evaluating itemized lead-time accuracy, price variance, and inbound defect statistics.
6. **Procurement Cash-Flow Forecast:** Links current `Purchase_Orders` values with warehouse receipt calendars to projection-model corporate accounts payable.
7. **Production Floor Live Monitor:** Tracks line utilization rates and counts manufactured volume against daily corporate capacity thresholds.
8. **End-to-End Batch Traceability Tree:** Search tool that allows users to audit any unique batch number backwards to its suppliers or forwards to its end consumers.
9. **Scrap Factor & Defect Pareto Analysis:** Isolates the root causes of factory waste by category (e.g., machine error, poor raw materials).

C. Warehouse & Inventory Optimization

10. **Warehouse Capacity Cubage Heatmap:** Visualizes space allocation across dry, chilled, and frozen zones to prevent overstocking.
11. **Stock-Out Proactive Risk Alerts:** Dynamic list identifying active SKUs rapidly approaching or dipping below their specific `Reorder_Level`.
12. **Dead Stock & Shelf-Life Expiry Tracker:** Flags slow-moving cargo and issues warnings for product batches nearing their maximum safe shelf life.

D. Transportation, Fleet & IoT Telemetry

13. **Live Fleet GIS Telematics Matrix:** Interactive maps utilizing live IoT sensor feeds to report truck speeds, coordinates, engine heat, and fuel lines.
14. **Driver Behavior & Risk Profiling:** Ranks drivers based on detected high-risk telematics events such as harsh acceleration or route non-compliance.

15. **Fuel Loss & Theft Detection Control:** Cross-references sudden fuel tank gauge drops against actual mileage to isolate potential theft or leakage events.
16. **Preventative Fleet Maintenance Hub:** Automates scheduling workflows by tracking mileage milestones and upcoming mandatory service timelines.

E. Intelligent RAG & Agentic Operations Layers

17. **AI Agent Actions Command Board:** Live stream tracking automated system interventions, including automatic maintenance rerouting and alternative fulfillment.
 18. **Predictive Demand Forecasting Engine:** Applies historical transaction data and seasonality factors to build dynamic quarterly stock expectations.
 19. **Reverse Logistics Loss Attribution Chart:** Financial analysis showing hidden cost footprints from client product returns, directly assigning accountability.
 20. **SLA Breach Root-Cause Matrix:** Traces missed delivery windows back to the exact fault point, whether a vendor delay, factory failure, or truck breakdown.
-

8. Standardized SSRS Paginated Operating Reports (6 Structured Reports)

1. **Daily Warehouse Balance Position Snapshot:** Formal corporate ledger auditing starting/ending balances, reserved volumes, and on-hand assets per facility.
2. **Monthly Vendor SLA Audit Ledger:** Printed commercial compliance score report verifying supplier arrival consistency, shortages, and price changes.
3. **Fleet Cost & Expense Itemization Log:** Financial document attributing fuel, maintenance, tolls, and driver payouts directly to unique trips.
4. **Shift Production Quality & Lab Log:** Compliance document logging raw material usage, verified batch specifications, and QA laboratory signs.
5. **Trip Manifest & Delivery Discrepancy Receipt:** Formal document listing sequence drop-offs, delivery statuses, and missing item declarations.
6. **Reverse Logistics Damage Disposal Summary:** Official internal audit record detailing financial losses from returns, product damage codes, and disposal costs.
